

A Practical Guide to Amelia: A Domain Specific Language for Automated Software Deployment

October 2017

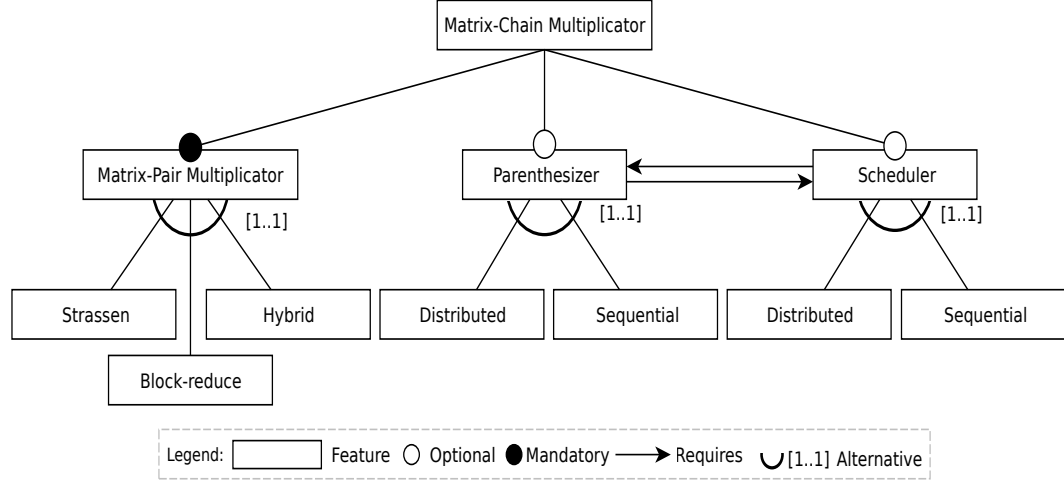

1 Introduction

To facilitate and promote the use of the AMELIA DSL, our language that assists application developers in automating the deployment of component-based software systems, we designed a deployment case study to use the main features of AMELIA. Through this practical guide, a *software deployer* will be able to get a deeper understanding of the constructs defined in AMELIA, which will increase the deployer's ability for specifying the required deployment specifications with the language.

2 Case Study: The Matrix-Chain Multiplication Problem

The Matrix-Chain Multiplication (MCM) problem is an optimization problem that consists in finding the most efficient multiplication sequence to multiply a set of given matrices. Our implementation of the MCM, provided to the workshop participants, splits the problem into three different subproblems: the matrix-pair multiplication problem, the matrix-chain parenthesization problem, which finds the optimal sequence of matrix-pair multiplications minimizing the number of individual additions and multiplications, and the matrix-subchain multiplication scheduling problem, which finds subsets of matrix multiplications that can be performed concurrently to decrease the overall multiplication time [1]. In this way, by combining the different solutions to these subproblems, it is possible to configure several different actual solutions to the whole problem, which raises a problem of solution configuration. For instance, by combining the first and second subproblems, one can obtain a solution able to multiply a set of given matrices reducing the number of individual arithmetical operations. In the same sense, by combining the first and third subproblems, one would obtain the same solution aforementioned, but this time reducing multiplication time. And of course, by combining the three subproblems one would reduce both operations and overall processing time. In practice, however, there can be computational limitations and trade-offs that may make infeasible some of the

possible solution configurations.

In this implementation of the MCM solution, we take advantage of distributed computational resources in order to reduce the execution time when multiplying a large number of considerably big matrices. To this end, we developed two multiplication strategies, one based on the map-reduce architecture, and a variation of it that significantly reduces network usage. At the end, local multiplications are performed using the Strassen algorithm.

The following deployment diagrams depict the high-level elements composing each of the multiplication strategies. For sake of simplicity, we omit the details of the scheduling and parenthesizing subproblems. As there is only one artifact per strategy (*i.e.*, one resulting artifact of the compilation process), a note on each diagram specifies the node in which the components are executed.

2.1 BlockReduce Strategy

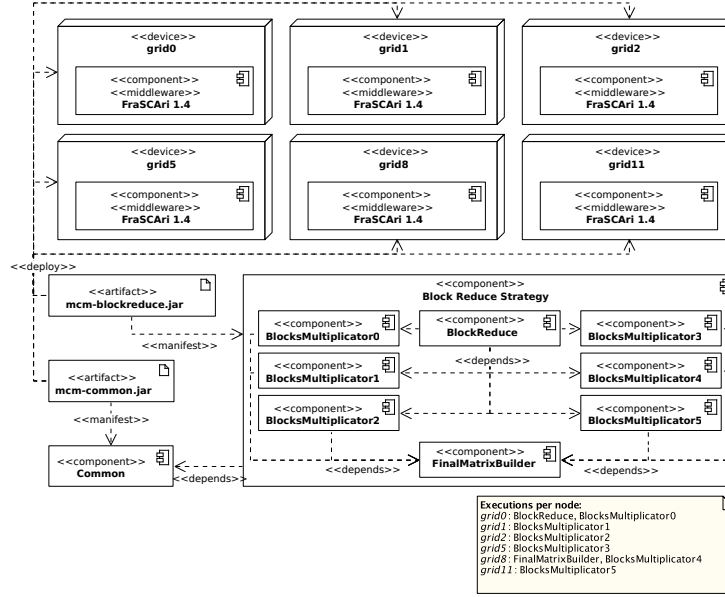

Figure 1: Deployment Diagram for the BlockReduce Configuration Strategy

The BlockReduce configuration strategy consists in splitting each matrix into fixed-size blocks (*i.e.*, sub-matrices) and multiply them as if they were one cell instead of a group of them. For instance, having two squared matrices A and B , partitioned into 4 blocks each, the resulting matrix C would be calculated using the same blocks partition strategy. C_{00} represents the first block of C , and would be calculated by operating A and B such that $C_{00} = A_{00} * B_{00} + A_{01} * B_{10} + A_{02} * B_{20} + A_{03} * B_{30}$. In this strategy, the block size is crucial to find the threshold between the amount of data transmitted over the network and the size of the blocks to multiply, in order to reduce the multiplication time. We performed several experiments and found that for matrices of approximately 3600x3600 elements, the block size with best execution times is 200.

2.2 Hybrid Configuration Strategy

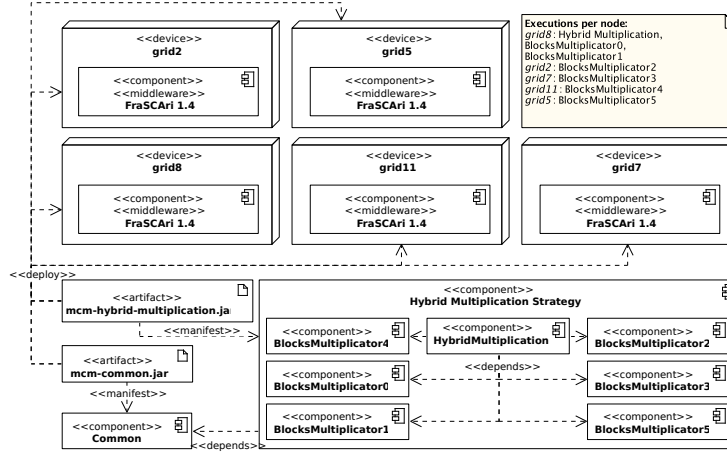

Figure 2: Deployment Diagram for the Hybrid Configuration Strategy

The Hybrid configuration strategy introduces an improvement, in terms of network usage, to the BlockReduce configuration strategy. However, it is more demanding in terms of processor and memory usage. In the strategy above, calculating a block in the resulting matrix requires sending as many pairs of blocks as columns or rows of blocks are, while in this strategy it only requires sending the whole column and row of blocks. Another advantage of this strategy is that it also reduces the amount of processors necessary to multiply the blocks.

3 The Amelia Language: Specification Examples

AMELIA allows specifying two types of elements: Subsystems and Deployments. Along with this practical guide you will be given an overview of the language syntax and the associated semantics. The following examples describe two deployment requirements and their corresponding solution in AMELIA.

3.1 Requirement 1 (Example)

Specify the deployment of the BlockReduce strategy having into account component dependencies and the computing nodes specified in the deployment diagram. You may use the following file containing a mapping between the hosts in the deployment diagrams and the laboratory's computers.

```
1 hgrid1    21 22 root    liasondriso_hgrid1    grid0
2 hgrid17   21 22 root    liasondriso_hgrid2    grid1
```

```

3 hgrid16  21 22 root  liasondriso_hgrid3  grid2
4 hgrid15  21 22 root  liasondriso_hgrid4  grid3
5 hgrid12  21 22 root  liasondriso_hgrid5  grid4
6 hgrid9   21 22 root  liasondriso_hgrid6  grid5
7 hgrid6   21 22 root  liasondriso_hgrid7  grid6
8 hgrid10  21 22 root  liasondriso_hgrid10 grid7

```

Listing 1: hosts.txt

3.1.1 Reusing code with Amelia

In order to reduce the size of the deployment specifications with AMELIA and promote reuse and maintainability concerns, we should begin the specification process through the identification and definition of elements that could be used repeatedly over this process. In case, we created a subsystem called *Common*, which contains common definitions for all of the deployments/subsystems.

```

1 package co.edu.icesi.driso.matrices
2
3 import java.util.List
4 import java.util.Map
5 import org.amelia.dsl.lib.descriptors.Host
6
7 /*
8  * Common definitions for all of the
9   * deployments/subsystems.
10 */
11 subsystem Common {
12     /*
13     * All hosts.
14     */
15     param Map<String, Host> hosts
16
17     //-----
18     // Compilation parameters
19     //-----
20
21     /*
22     * Compilation host.
23     */
24     var Host compilationHost = hosts.get("grid0");
25
26     /*
27     * Sources to compile.
28     */
29     var String commonSources =
        "/home/sas1/LF_RIVERA/workspace-matrices/org.driso.matrices.common";

```

```

30     var String blockRSources =
31         "/home/sas1/LF_RIVERA/workspace-matrices/org.drisko.matrices.blockreduce";
32     var String hybridSources =
33         "/home/sas1/LF_RIVERA/workspace-matrices/"
34         + "org.drisko.matrices.hybrid_multiplication";
35     var String nMatricesSources =
36         "/home/sas1/LF_RIVERA/workspace-matrices/org.drisko.matrices.nmatrices";
37     var String strassenSources =
38         "/home/sas1/LF_RIVERA/workspace-matrices/org.drisko.matrices.strassen";
39
40     /*
41     * Compilation sources.
42     */
43     var List<String> sources = #[
44         commonSources, blockRSources, hybridSources,
45         nMatricesSources,
46         strassenSources
47     ]
48
49     /*
50     * Built sources folder (The site where compilation
51     * artifacts are located).
52     */
53     var String builtFolder =
54         "/home/sas1/LF_RIVERA/workspace-matrices/built-sources";
55
56     //-----
57     // Allocation parameters
58     //-----
59
60     /*
61     * The folder in the execution nodes where artifacts
62     * are allocated.
63     */
64     var String allocationTargetFolder = "/home/sas1/";
65
66     /*
67     * Target sources folder in the execution nodes
68     * (The site where the jars are executed).
69     */
70     var String builtFolder =
71         'allocationTargetFolderbuilt-sources';
72 }

```

Listing 2: Subsystem *Common* for reusable definitions.

3.1.2 Compiling sources with Amelia

Since the addressed problem comprises multiple deployment strategies, we must compile certain software project sources for generating the desired specific artifacts to be deployed. In contemplation of standardization, we define a Java Enum for defining the possible deployment configurations for the matrix-chain multiplication problem.

```
1 package co.edu.icesi.driso.matrices.classes;
2
3 /**
4  * The mcm strategies.
5  * @author Miguel Jimenez (miguel@uvic.ca)
6  * @date 2017-08-19
7  * @version $Id$
8  * @since 0.0.1
9  */
10 public enum Strategy {
11     BLOCK_REDUCE,
12     HYBRID_MULTIPLICATION,
13     N_MATRICES,
14     STRASSEN
15 }
```

Listing 3: Java Enum for possible deployment configurations.

```
1 package co.edu.icesi.driso.matrices.deployments
2
3 import co.edu.icesi.driso.matrices.classes.Strategy
4 import java.util.List
5 import java.util.Map
6 import org.amelia.dsl.lib.descriptors.Host
7 import org.amelia.dsl.lib.util.Hosts
8
9 includes co.edu.icesi.driso.matrices.Common
10 includes co.edu.icesi.driso.matrices.Compile
11 includes co.edu.icesi.driso.matrices.Allocation
12 includes co.edu.icesi.driso.matrices.BlockReduce
13
14 /*
15  * Deploy the BlockReduce strategy once and then
16  * stop the executed components.
17  */
18 deployment SimpleBlockReduce {
19     // Load all hosts and then filter
20     val Map<String, Host> hosts =
21         Hosts.hosts("hosts.txt").toMap[h|h.identifier]
21     val List<Host> executionHosts = #[
```

```

22     hosts.get("grid1"), hosts.get("grid2"),
        hosts.get("grid3"),
23     hosts.get("grid4"), hosts.get("grid5"),
        hosts.get("grid6")
24 ]
25
26 // Add subsystems to deploy
27 add(new Common(hosts))
28 add(new Compile(Strategy.BLOCK_REDUCE, hosts))
29 add(new Allocation(executionHosts, hosts))
30 add(new BlockReduce(executionHosts, hosts))
31
32 // Deploy and then stop the executed components
33 start(true)
34 }

```

Listing 4: Deployment for BlockReduce

We defined a subsystem called *Compile* for the compilation of the associated source projects. This subsystem has a parameter for indicating the desired deployment strategy to be compiled.

```

1 package co.edu.icesi.driso.matrices
2
3 import co.edu.icesi.driso.matrices.classes.Strategy
4
5 includes co.edu.icesi.driso.matrices.Common
6
7 /*
8  * Compile each strategy's source code.
9  */
10 subsystem Compile {
11     /*
12      * The multiplication strategy to compile.
13      */
14     param Strategy strategy
15
16     on compilationHost {
17         compileCommon:
18         cd sources.get(0)
19         compile "src" "mcm-common"
20         cmd 'yes | cp -f mcm-common.jar builtFolder/'
21     }
22
23     on compilationHost ? strategy ==
        Strategy.BLOCK_REDUCE {
24         strategy1: compileCommon;
25         cd sources.get(1)
26         compile "src" "mcm-blockreduce" -classpath
            'builtFolder/mcm-common.jar'

```

```

27         cmd 'yes | cp -f mcm-blockreduce.jar
           builtFolder'
28     }
29
30     on compilationHost ? strategy ==
31         Strategy.HYBRID_MULTIPLICATION {
32         strategy2: compileCommon;
33         cd sources.get(2)
34         compile "src" "mcm-hybrid-multiplication"
35             -classpath 'builtFolder/mcm-common.jar'
36         cmd 'yes | cp -f mcm-hybrid-multiplication.jar
37             builtFolder'
38     }
39
40     on compilationHost ? strategy == Strategy.N_MATRICES {
41     strategy3: compileCommon;
42     cd sources.get(3)
43     compile "src" "mcm-nmatrices" -classpath
44         'builtFolder/mcm-common.jar'
45     cmd 'yes | cp -f mcm-nmatrices.jar builtFolder'
46 }
47
48     on compilationHost ? strategy == Strategy.STRASSEN {
49     strategy4: compileCommon;
50     cd sources.get(4)
51     compile "src" "mcm-strassen" -classpath
52         'builtFolder/mcm-common.jar'
53     cmd 'yes | cp -f mcm-strassen.jar builtFolder'
54 }
55 }

```

Listing 5: Subsystem *Compile* for compiling the source code.

3.1.3 Artifacts transportation with Amelia

Once artifacts have generated from source code, they need to be transported (along with dependency libraries) to the computing nodes where they are going to be deployed. AMELIA supports this requirement through the use of a command called *scp*, nevertheless, in order to work, this command requires the configuration of an FTP Server. For sake of simplicity, we decided to exploit the extensibility of AMELIA and created a new user-defined command that leverage the SSH-based secure copy command of Linux. For this purpose, we created a new class which contains a method for describing the user-defined AMELIA command.

```

1 package co.edu.icesi.driso.matrices.classes;
2
3 import java.io.IOException;

```

```

4 import org.amelia.dsl.lib.CallableTask;
5 import org.amelia.dsl.lib.descriptors.CommandDescriptor;
6 import org.amelia.dsl.lib.descriptors.Host;
7 import net.sf.expectit.Expect;
8 import net.sf.expectit.matcher.Matchers;
9
10 public class SCPLogin {
11
12     public static CommandDescriptor scpCommand(final
        String hostName,
13         final String hostPassword, final String source,
        final String target) {
14         return new CommandDescriptor.Builder()
15             .withSuccessMessage("Copied file!")
16             .withErrorMessage("File couldn't be copied!")
17             .withCallable(new CallableTask<Object>() {
18                 @Override
19                 public Boolean call(Host host, String
                    prompt, boolean quiet)
20                     throws Exception {
21                     final Expect session =
22                         host.ssh().expect();
23                     session.sendLine(
24                         String.format(
25                             "scp -r root%s:%s %s",
26                             hostName,
27                             source,
28                             target
29                         )
30                     );
31                     try {
32                         session.expect(
33                             Matchers.regex("Are you sure you
                                want to continue connecting
                                (yes/no)?")
34                         );
35                         session.sendLine("yes");
36                     } catch (IOException e) {
37                         // Do nothing
38                     }
39                     session.expect(
40                         Matchers.regex(
41                             String.format(
42                                 "root%s's password:",
43                                 hostName
44                             )
45                         )
46                     );
47                     session.sendLine(hostPassword);
48                     session.expect(Matchers.regex(prompt));

```

```

48             return true;
49         }
50     }).build();
51 }
52
53 }

```

Listing 6: Class for defining a user-defined AMELIA command.

With that in mind, we proceed to define a subsystem called *Allocation* that allows the transportation of compiled artifacts and dependency libraries to the computing nodes where they will be deployed, i.e., the subsystem allocate software artifacts to executing computing nodes. This subsystem uses the user-defined command described previously.

```

1 package co.edu.icesi.driso.matrices
2
3 import co.edu.icesi.driso.matrices.classes.SCPLogin
4 import java.util.List
5 import org.amelia.dsl.lib.descriptors.Host
6
7 includes co.edu.icesi.driso.matrices.Common
8
9 depends on co.edu.icesi.driso.matrices.Compile
10
11 subsystem Allocation {
12
13     param List<Host> executionHosts
14
15     on executionHosts {
16         move:
17             SCPLogin.scpCommand(
18                 compilationHost.hostname,
19                 compilationHost.password,
20                 builtFolder,
21                 allocationTargetFolder
22             )
23     }
24
25 }

```

Listing 7: Subsystem for artifacts allocation to computing nodes.

Once we granted the compilation and transportation of artifacts to the computing nodes that will execute them, we proceed to define two subsystems called *BlockReduce* and *Hybrid* that execute their associated strategy.

3.1.4 Execution of BlockReduce strategy

```

1 package co.edu.icesi.driso.matrices
2
3 import java.util.List
4 import org.amelia.dsl.lib.descriptors.Host
5
6 includes co.edu.icesi.driso.matrices.Common
7
8 depends on co.edu.icesi.driso.matrices.Allocation
9
10 /*
11  * Execute the BlockReduce multiplication strategy.
12  */
13 subsystem BlockReduce {
14
15     param List<Host> executionHosts
16
17     var String common = "mcm-common"
18     var String artifact = "mcm-blockreduce"
19     var Iterable<String> libpath = #[
20         'buildsFolder/common.jar',
21         'buildsFolder/artifact.jar'
22     ]
23
24     on executionHosts {
25         init:
26             cd buildsFolder
27     }
28
29     on hosts.get("grid1") {
30         reducer0: matrixBuilder;
31         run "BlocksMultiplicator0" -libpath libpath
32
33         control: reducer0, reducer1, reducer2, reducer3,
34             reducer4, reducer5;
35         run "Blockreduce" -libpath libpath
36     }
37
38     on hosts.get("grid2") {
39         reducer1: matrixBuilder;
40         run "BlocksMultiplicator1" -libpath libpath
41     }
42
43     on hosts.get("grid3") {
44         reducer2: matrixBuilder;
45         run "BlocksMultiplicator2" -libpath libpath
46     }
47
48     on hosts.get("grid4") {
49         reducer3: matrixBuilder;

```

```

49         run "BlocksMultiplicator3" -libpath libpath
50     }
51
52     on hosts.get("grid5") {
53         matrixBuilder: init;
54         run "FinalMatrixBuilder" -libpath libpath
55
56         reducer4: matrixBuilder;
57         run "BlocksMultiplicator4" -libpath libpath
58     }
59
60     on hosts.get("grid6") {
61         reducer5: matrixBuilder;
62         run "BlocksMultiplicator5" -libpath libpath
63     }
64
65 }

```

Listing 8: Subsystem for executing BlockReduce strategy.

3.1.5 Execution of Hybrid strategy

```

1  package co.edu.icesi.driso.matrices
2
3  includes co.edu.icesi.driso.matrices.Common
4
5  depends on co.edu.icesi.driso.matrices.Allocation
6
7  /*
8   * Execute the Hybrid multiplication strategy.
9   */
10 subsystem HybridMultiplication {
11
12     var String common = "mcm-common"
13     var String artifact = "mcm-hybrid-multiplication"
14     var Iterable<String> libpath = #[
15         'buildsFolder/artifact.jar',
16         'buildsFolder/common.jar'
17     ]
18
19     on hosts.get("grid5") {
20         reducer0:
21             run "BlocksMultiplicator0" -libpath libpath
22
23         reducer1:
24             run "BlocksMultiplicator1" -libpath libpath
25
26         control: reducer0, reducer1, reducer2, reducer3,
                reducer4, reducer5;

```

```

27         run "HybridMultiplication" -libpath libpath
28     }
29
30     on hosts.get("grid3") {
31         reducer2:
32         run "BlocksMultiplicator2" -libpath libpath
33     }
34
35     on hosts.get("grid7") {
36         reducer3:
37         run "BlocksMultiplicator3" -libpath libpath
38     }
39
40     on hosts.get("grid6") {
41         reducer4:
42         run "BlocksMultiplicator4" -libpath libpath
43     }
44
45     on hosts.get("grid4") {
46         reducer5:
47         run "BlocksMultiplicator5" -libpath libpath
48     }
49
50 }

```

Listing 9: Subsystem for executing Hybrid strategy.

Finally, we proceed to define one custom deployment for each strategy to be deployed. The custom deployment uses the subsystems defined previously.

3.1.6 Custom deployment for BlocReduce strategy

```

1 package co.edu.icesi.driso.matrices.deployments
2
3 import co.edu.icesi.driso.matrices.classes.Strategy
4 import java.util.List
